

COMBINATION LOCK CHANGEABLE IN COMBINATION

ABSTRACT

5 A combination lock includes a female member, a lock rod inserted
in the female member; the female member is inserted through single dial,
several actuating rings, and co-moving rings; the dial and the actuating
rings are arranged side by side, and releaseably engaged with respective
co-moving rings; the dial and an actuating ring adjacent thereto have a
10 projecting portion on opposing sides while every two adjacent actuating
rings have a projecting portion on opposing sides such that the
co-moving rings can be turned to unlocking position where all gaps
thereof oppose a trench of the female member to form a passage for the
lock rod by operating the dial; orientations of the dial and the actuating
15 rings relative to respective co-moving rings are changed for changing the
unlocking combination by operating the dial after the dial and the
actuating rings are disengaged from the co-moving rings.
